DETAILED ACTION

Claims 1-16 are pending.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

1. Claims 1-16 are rejected under 35 U.S.C. 102(b) as being anticipated by US# 5,503,950 to Miyake et al.

Miyake teaches providing a phase shifter in a lithography mask. Miyake teaches for locally changing the film thickness of a multilayered film, the film may be locally heated. This causes an increase or decrease of the film thickness. Miyake teaches that the quantity of change in the film thickness can be controlled by heating temperature or heating time. Miyake teaches heating is performed using an energy beam such as electron beam, ion beam or laser (optical) beam (col. 3, lines 15-25). In embodiment 1, Miyake teaches forming alternate layers of molybdenum and silicon on a substrate (col. 3, lines 35-45). Miyake teaches locally heating a portion 2a of the multilayer film with an energy beam to provide phase shifter means. The period of the multilayered film in the heated portion was decreased as shown in Figure 1 and the step height was reduced (col. 3, lines 45-53). As shown in the figures and disclosed, the heating caused a contraction or reduction in volume in the heated portion. Miyake also teaches heating at a temperature of 100 degrees Celsius or 300 degrees Celsius (Abstract). When molybdenum

and silicon are heated, it is inherent that molybdenum silicide is formed. Miyake teaches that phase shift portions are formed. Molybdenum silicide is inherently a phase shifting material. Because Miyake teaches forming a phase shifting material through localized heating, Miyake teaches adjusting for optical limitations, as phase shifting aids in optical exposure. The molybdenum silicide also aids in proximity effect and line end shortening.

Double Patenting

2. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

3. Claims 1-16 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-12 of U.S. Patent No. 6,756,158 to Yan. Although the conflicting claims are not identical, they are not patentably distinct from each other because the claims of the patent fully encompass the present claims.
